Alcohol

Neurobiology of alcohol and the brain

According to the 2018 National Survey on Drug Use and Health, 14.4 million adults aged 18 and older had alcohol use disorder (AUD). Mixing alcohol with other drugs such as opioids or cocaine has become an emerging trend, exacerbating public health concerns and may synergistically augment the seriousness of the adverse effects such as withdrawal symptoms, cardiovascular disorders, liver damage, reproductive abnormalities, and behavioral abnormalities. Despite the seriousness of the situation, possible mechanisms underlying the addiction and the withdrawal symptoms is not yet understood. This has been one of the key hindrances in developing effective treatment. Neurobiology of Alcohol and the Brain addresses the addiction-related problems reviewing both the mechanisms and withdrawal

system with alcohol addiction. First, the book discusses the mechanisms of the rewarding and aversive effects, including addiction and the withdrawal symptoms of alcohol drinking. Next, alcohol's interaction with other drugs and ensuing adverse consequences is discussed including current and novel treatments against alcoholism. This is followed by a closer look at mental health and alcohol use disorder comorbidity. Lastly, the reader is provided with examples of an experimental study that describes possible protective effects of gold nanoparticles against alcohol addiction in rats subjected to alcohol self-administration. Neurobiology of Alcohol and the Brain will unlock the mechanistic diversities of alcoholism helping to facilitate future developments of new, personalized treatment options for patients suffering from alcohol addiction.

AOD Issues

Nutt Uncut

David Nutt regularly hit the headlines as the UK's forthright Drugs Czar (Chair of the Advisory Council on the Misuse of Drugs), not least when fired by the Home Secretary in 2009 for his 'inconvenient' views. In Nutt Uncut he explains how he survived ill-judged political and media vilification to establish the respected charity Drug Science, with the aim of telling the truth about drugs. The book describes his life, distinguished career, and scientific achievements, including his research into the human brain and the effects that both lawful and criminally illegal substances (including psychedelics) have on the brain and behaviour. It also catalogues with expert precision the risks of harm to drug users and others of a range of well-known drugs. Surveying the state of medical knowledge around various currently prohibited substances -- from hard drugs to LSD, cannabis, ecstasy, magic mushrooms and poppers -- Professor Nutt ranks their potential harms and benefits (e.g. in treating anxiety, depression or pain) leading him to challenge the distorted logic of a blanket ban on anything psychoactive except alcohol, tobacco and caffeine. Nutt Uncut contains far, far more about the usually hidden world of drugs, their use, abuse, and role as a political bargaining counter -- making it of interest not just to the many experts and others who already support the author's campaign for a frank, evidence-based approach to drugs but also anyone who wishes to learn about what he describes in Chapter 11 as 'policy madness.'

Cannabis

Food safety lessons for cannabis-infused edibles

Food Safety Lessons for Cannabis-Infused Edibles details the world of cannabis-infused edibles and the way its manufacturing is evolving as the industry moves from isolation to regulatory compliance. The cannabis industry has unique challenges as cannabis-infused edibles are not regulated as food, drugs, or dietary supplements at the federal level. Despite these current conditions, the industry is aware of the need to examine the safety of these edibles and prepare for a future of federal compliance. The book looks at the cannabis industry through a scientific lens to increase awareness and expertise in food safety within the field of cannabis-infused edibles.

Regulating cannabis: A global review and future directions

This book explores one of the most pressing public policy questions for the 2020s: how should we regulate cannabis? The global cannabis prohibition regime is fragmenting as more countries experiment with decriminalization and legalization, and this book aims to make sense of this rapidly changing world. The 'cannabis challenge' is complex. How do we balance creating a potentially lucrative legal cannabis industry with protecting public health? How do we hardwire social and racial justice into our reform initiatives? How do we build a cannabis trade that is environmentally sustainable? The book seeks to make sense of our present through a state-of-the-art global review of cannabis law reform initiatives - mapping what has been done, where, and with what impacts. It attempts to generate new ideas for the future of cannabis regulation by viewing it through the lens of business regulation and learning lessons from how other consumer products are regulated.

Drink Spiking

Drink spiking and predatory drugging: A modern history

This book analyses common perceptions about drink-spiking, a pervasive fear for many and sometimes a troubling reality. Ideas about spiked drinks have shaped the way we think about drugs, alcohol, criminal law, risk, nightspots, and socializing for over one hundred and fifty years, since the rise of modern anesthesia and synthetic 'pharma-ubiquity'. The book offers a wide-ranging look at the constantly shifting cultural and gender politics of 'psychochemical treachery'. It provides rich case histories, assesses evolving scientific knowledge, and analyses the influence of social forces as disparate as Temperance and the acid enthusiasts of the 1960s. Drawing on interdisciplinary research, the book will be of great interest to upper-level students and scholars of criminal law, forensic science, public health, and social movements.

Driving

Alcohol, drugs, and impaired driving: Forensic science and law enforcement issues

Alcohol, Drugs, and Impaired Driving addresses many theoretical and practical issues related to the role played by alcohol and other psychoactive drugs on driving performance, road-traffic safety, and public health. Several key forensic issues are involved in the enforcement of laws regulating driving under the influence of alcohol and/or other drugs, including analytical toxicology, pharmacology of drug action, as well as the relationships between dose taken, concentration levels in the body, and impairment of performance and behavior. Our knowledge of drunken driving is much more comprehensive than drugged driving, so a large part of this book is devoted to alcohol impairment, as well as impairment caused by use of drugs other than alcohol. For convenience, the book is divided into four main sections. The first section gives some historical background about measuring alcohol in blood and breath as evidence for the prosecution of traffic offenders. The important role of the Breathalyzer instrument in traffic-law enforcement, especially in Australia, Canada, and the USA is presented along with a biographical sketch of its inventor (Professor Robert F. Borkenstein of Indiana University) with focus on the man, his work, and his impact. The second section discusses several issues related to forensic blood and breath-alcohol alcohol analysis as evidence for prosecution of traffic offenders. This includes how the results should be interpreted in relation to impairment and an evaluation of common defense challenges. Because most countries have adopted concentration per se laws, the main thrust of the prosecution case is the suspect's measured blood- or breath-alcohol concentration. This legal framework necessitates that the analytical methods used are "fit for purpose" and are

subjected to rigorous quality assurance procedures. The third section gives a broad overview of the current state of knowledge about driving under the influence of non-alcohol drugs in various countries. This includes adoption of zero-tolerance laws, concentration per se statutes, and clinical evidence of driver impairment based on field sobriety tests and drug recognition expert evidence. The fourth section deals with epidemiology, enforcement, and countermeasures aimed at reducing the threat of drunken and drugged driving. All articles have appeared previously in the international journal *Forensic Science Review*, but all are completely updated with current data, references, and the latest research on developments since the articles were published.

Drug Use and Dependence

Drug use for grown-ups: Chasing liberty in the land of the free

From one of the world's foremost experts on the effects of recreational drugs on the mind and body, a powerful argument that the greatest dangers from drugs flow from their being illegal, and a field guide to their use as part of a responsible and happy life. Dr. Carl Hart, Ziff Professor at Columbia University and former Chair of the Department of Psychology, is one of the world's preeminent experts on the effects of so-called recreational drugs on the human mind and body. Dr. Hart also is open about the fact that he uses drugs himself, in a happy balance with the rest of his full and productive life as a colleague, husband, father and friend. In *Drug Use for Grown-Ups*, he draws on both decades of research and his own personal experience to argue definitively that the criminalization and demonization of drug use is itself far and away the greatest scourge drugs inflict on America. Carl Hart did not always have this view, to put it mildly. He came of age in one of Miami's most troubled neighborhoods at a time when many ills were being laid at the door of crack cocaine. His initial work as a researcher was aimed at proving that drug use caused predominantly bad outcomes. But one problem kept cropping up: the evidence from his research did not support his hypothesis. *Drug Use for Grown-Ups* will be controversial, to be sure: it challenges head-on some of our strongest moral reflexes about drugs and citizenship. The propaganda war, Hart argues, has been tremendously effective. Imagine if the only subject of any conversation about driving automobiles was fatal car crashes. We regulate driving, just as we regulate alcohol. During Prohibition, fatalities from alcohol use skyrocketed, because people didn't know what they were drinking, and hundreds of thousands were inadvertently poisoned. *Drug Use for Grown-Ups* offers a radically different vision: of how, when used responsibly, drugs can powerfully enrich and enhance our lives. The nexus of special interests that benefit from drug criminalization and demonization, Hart shows us, has kept this country in a terrible place, but change is beginning to come. Ultimately this is about education: the facts are clear. In every country with a more permissive and humane drug regime, all human outcomes are better, from mortality to addiction to overall quality of life, and the countries with the most permissive regimes, like Portugal and Switzerland, have the best outcomes.

Drug Use and the Family

We often think of drug addiction as something that happens to an individual. That's true but addiction is also something that happens to an entire family. Sometimes it's parents who are emotionally and financially drained by caring for a young substance user. Other times kids are forced to grow up too fast because a parent is struggling with drugs or alcohol. This book explores the many ways in which addiction impacts families and how family members can help each other. Discusses the effects on families of drug abuse by any of its members, especially on the children of adult users and the parents of teenagers and considers therapy options.

FASD

A Manual on Adolescents and Adults with Fetal Alcohol Syndrome

Fetal Alcohol Syndrome (FAS) is a major concern in communities where women drink heavily. American Indian communities appear to be particularly at risk (1). While some information is available on younger children with Fetal Alcohol Syndrome (FAS) and Fetal Alcohol Effects (FAE), little was known about adolescents and adults with this disorder until the present project was undertaken. This report is based on information gained from the FAS Follow-Up Study which involved assessments of 61 adolescents and adults who previously had been given a diagnosis of FAS or FAE, and interviews with their families, schoolteachers, and social service personnel. This manual is directed toward those who are involved in giving care and providing services to adolescents and adults with FAS and FAE. These include both caretakers and physicians, as well as nurses, schoolteachers, social workers, court workers and tribal councils. While the majority of patients in the follow-up study are American Indian, the concerns regarding FAS and FAE transcend culture, race, gender, and socioeconomic status. It is our hope that the information contained herein will result in a better understanding of adolescents and adults with FAS and FAE and that this understanding of their special problems and needs will lead to more adequate planning by community agencies and better care for affected individuals. We hope that by demonstrating the lifelong impact of FAS, this manual will also encourage even more vigorous prevention and education efforts and a decrease in this preventable form of mental retardation and developmental disability. We begin with some background information, then describe the research project, and finally present general and specific recommendations for helping adolescents and adults with FAS and their families.

Law

Child Rights and Drug Control in International Law

Responding to the harms caused by drugs is one of the most challenging social policy issues of our time. In 'Child Rights and Drug Control on International Law', Damon Barrett explores the meaning of the child's right to protection from drugs under the Convention on the Rights of the Child, and the relationship between this right and the UN drug control conventions. Adopting a critical approach, the book traces the intersecting histories of the treaties, the role of child rights in global drug policy discourse, and the practice of the Committee on the Rights of the Child. It invites us to reflect upon the potential for child rights to provide justification for state actions associated with wider human rights risks.

Drug control and international law

This book provides for an extensive legal analysis of the international drug control system in light of the growing challenges and criticism that this system faces. In the current debate on global drug policy, the central pillars of the international drug control system - the UN Drug Conventions as well as its institutions - are portrayed as outdated, suppressive and seen as an obstacle to necessary changes. The book's objective is to provide an in-depth and positivist insight into drug control's present legal framework and thus provide for a better understanding of the normative assumptions upon which drug control is currently based. This is attained by clarifying the objectives of the international drug control system and the premises by which these objectives are to be achieved. The objective of the current global framework of international drug control is the limitation of drugs to medical and scientific purposes. The meaning of this objective and its concrete implications for States' parties as well as assists problems from the perspective of other regimes of international law, most notably international human rights law, are extensively analysed. Additionally, the book focuses on how the international drug control system attempts to reach the objective of confining drugs to medical and scientific purposes, i.e. by setting up a universal system that exercises a rigid control on drug supply. The consequences of this heavy focus on the reduction of drug supply are outlined, and the book concludes by making suggestions on how the international drug control system could be reformed in the near future in order to better meet the existing challenges. The analysis occurs from a general international law perspective. It aims to map the international drug control system within a wider context of international law and to understand whether the problems that the international drug control system faces are exemplary for the difficulties that institutionalized systems of global scope face in the twenty-first century.

Overdose

OD: Naloxone and the politics of overdose

The history of an unnatural disaster--drug overdose--and the emergence of naloxone as a social and technological solution. For years, drug overdose was unmentionable in polite society. OD was understood to be something that took place in dark alleys--an ugly death awaiting social deviants--neither scientifically nor clinically interesting. But over the last several years, overdose prevention has become the unlikely object of a social movement, powered by the miracle drug naloxone. In OD, Nancy Campbell charts the emergence of naloxone as a technological fix for overdose and describes the remaking of overdose into an experience recognized as common, predictable, patterned--and, above all, preventable. Naloxone, which made resuscitation, rescue, and "reversal" after an overdose possible, became a tool for shifting law, policy, clinical medicine, and science toward harm reduction. Liberated from emergency room protocols and distributed in take-home kits to non-medical professionals, it also became a tool of empowerment. Campbell describes how naloxone emerged as a tool of harm reduction. She reports on naloxone use in far-flung locations that

include post-Thatcherite Britain, rural New Mexico, and cities and towns in Massachusetts. Drawing on interviews with approximately sixty advocates, drug users, former users, friends, families, witnesses, clinicians, and scientists--whom she calls the "protagonists" of her story--Campbell tells a story of saving lives amid the complex, difficult conditions of an unfolding unnatural disaster.

Sport

Sport, alcohol and social inquiry: A global cocktail

In recent years, the relationship between sport and alcohol has become an increasingly popular topic for study, with many current research projects and publications aligning with a public health or medical focus. This volume prioritizes social inquiry and an emphasis on the sociological study of sport and alcohol to help (re)shape the terms of ongoing debates on this topic. Both emerging and expert scholars capture the contested terrain of the sport-alcohol nexus, exploring a range of issues and controversies with a specific focus on promotional culture, policy legislation/regulation, and identity politics. Chapters discuss the intricate social connections of what has become an entrenched, naturalized and global culture of alcohol promotion and consumption within sport. This volume is intentionally global in focus (with geographical regions represented by both chapter topics as well as contributors) and each chapter adds a truly valuable 'spirit' to making sense of the complex relationship between sport and alcohol.

Youth and substance abuse

This book provides a sociological examination of young people's pathways into, and out of, substance abuse. Drawing from in-depth, life-history interviews with over sixty young people who have experienced problematic drug use, the author uses participants' narratives to throw light on the relationship between trauma and issues such as homelessness, crime, and self-injury. Contesting the view that substance abuse is either a medical issue or individual failing, the book examines the wide variety of factors which lead to youth substance abuse such as extreme poverty and other structural factors. Whilst it does not overlook individual agency, the rich descriptions from young people's oral histories show us that the contexts in which agency was exercised, was often considerably constrained by significant structural forces. The sociological concept of 'situated choice', which is used to explain and understand how people make choices within their individual context, is used throughout the book as we witness young people wrestling to escape intergenerational disadvantage. The book will be of interest to scholars and students of Social Work, Youth, Sociology and Health Studies.
